
Bauble Documentation

Release 1.0.50

Brett Adams

marzo 22, 2018

Indice

1	not-so-brief list of highlights, meant to whet your appetite.	3
2	Istallare Bauble	7
3	Utilizzare Bauble	15
4	Amministrazione	31
5	Sviluppo di Bauble	33
6	Appoggiare Bauble	39

Bauble è un programma per la gestione di collezioni di oggetti botanici. Con Bauble puoi creare una base dati di registri di piante, con molte opzioni di ricerca.

Bauble è software [aperto e libero](#) ed è distribuito secondo la [GPL: Licenza Pubblica GNU](#)

not-so-brief list of highlights, meant to whet your appetite.

1.1 taxonomic information

When you first start Bauble, and connect to a database, Bauble will initialize the database not only with all tables it needs to run, but it will also populate the taxon tables for ranks family and genus, using the data from the “RBG Kew’s Family and Genera list from Vascular Plant Families and Genera compiled by R. K. Brummitt and published by the Royal Botanic Gardens, Kew in 1992”. In 2015 we have reviewed the data regarding the Orchidaceae, using “Tropicos, botanical information system at the Missouri Botanical Garden - www.tropicos.org” as a source.

1.2 importing data

Bauble will let you import any data you put in an intermediate json format. What you import will complete what you already have in the database. If you need help, you can ask some Bauble professional to help you transform your data into Bauble’s intermediate json format.

1.3 synonyms

Bauble will allow you define synonyms for species, genera, families. Also this information can be represented in its intermediate json format and be imported in an existing Bauble database.

1.4 scientific responsible

Bauble implements the concept of “accession”, intermediate between physical plant (or a group thereof) and abstract taxon. Each accession can associate the same plants to different taxa, if two taxonomists do not agree on the identification: each taxonomist can have their say and do not need overwrite each other’s work. All verifications can be found back in the database, with timestamp and signature.

1.5 helps off-line identification

Bauble allows you associate pictures to physical plants, this can help recognize the plant in case a sticker is lost, or help taxonomic identification if a taxonomist is not available at all times.

1.6 exports and reports

Bauble will let you export a report in whatever textual format you need. It uses a powerful templating engine named “mako”, which will allow you export the data in a selection to whatever format you need. Once installed, a couple of examples are available in the mako subdirectory.

1.7 annotate your info

You can associate notes to plants, accessions, species, Notes can be categorized and used in searches or reports.

1.8 garden or herbarium

Management of plant locations.

1.9 database history

All changes in the database is stored in the database, as history log. All changes are “signed” and time-stamped. Bauble makes it easy to retrieve the list of all changes in the last working day or week, or in any specific period in the past.

1.10 simple and powerful search

Bauble allows you search the database using simple keywords, e.g.: the name of the location or a genus name, or you can write more complex queries, which do not reach the complexity of SQL but allow you a decent level of detail localizing your data.

1.11 database agnostic

Bauble is not a database management system, so it does not reinvent the wheel. It works storing its data in a SQL database, and it will connect to any database management system which accepts a SQLAlchemy connector. This means any reasonably modern database system and includes MySQL, PostgreSQL, Oracle. It can also work with sqlite, which, for single user purposes is quite sufficient and efficient. If you connect Bauble to a real database system, you can consider making the database part of a LAMP system (Linux-Apache-MySQL-Php) and include your live data on your institution web site.

1.12 language agnostic

The program was born in English and all its technical and user documentation is still only in that language, but the program itself has been translated and can be used in various other languages, including Spanish (86%), Portuguese (100%), French (42%), to name some Southern American languages, as well as Swedish (100%) and Czech (100%).

1.13 platform agnostic

Installing Bauble on Windows is an easy and linear process, it will not take longer than 10 minutes. Bauble was born on Linux and installing it on ubuntu, fedora or debian is also rather simple. It has been recently successfully tested on MacOSX 10.9.

1.14 easily updated

The installation process will produce an updatable installation, where updating it will take less than one minute. Depending on the amount of feedback we receive, we will produce updates every few days or once in a while.

1.15 unit tested

Bauble is continuously and extensively unit tested, something that makes regression of functionality close to impossible. Every update is automatically quality checked, on the Travis

Continuous Integration service. Integration of TravisCI with the github platform will make it difficult for us to release anything which has a single failing unit test.

Most changes and additions we make, come with some extra unit test, which defines the behaviour and will make any undesired change easily visible.

1.16 customizable/extensible

Bauble is extensible through plugins and can be customized to suit the needs of the institution.

2.1 Installazione

`bauble.classic` è un programma multiplatforma e funziona su macchine unix (Linux e MacOSX) ma anche su Windows.

To install Bauble first requires that you install its dependencies that cannot be installed automatically. These include `virtualenvwrapper`, `PyGTK` and `pip`. Python and `GTK+`, you probably already have. As long as you have these packages installed then Bauble should be able to install the rest of its dependencies by itself.

Nota: Seguendo le seguenti istruzioni di installazione si ottiene un Bauble installato in un ambiente Python virtuale, tutte le dipendenze saranno installate localmente e non entreranno in conflitto con altri programmi Python che possono essere sullo stesso elaborator.

se dovessi in seguito decidere di rimuovere Bauble, basterà rimuovere l'ambiente virtuale, che è una directory, con tutto il suo contenuto.

2.1.1 Installare su Linux

1. Scaricare il programmino `devinstall.sh` ed eseguirlo:

```
https://raw.githubusercontent.com/Bauble/bauble.classic/master/  
→scripts/devinstall.sh
```

Nota bene: il programmino di cui sopra non installerà alcun connettore a base dati. Questo è lasciato per un passo successivo.

A titolo d'informazione, il programmino esegue i seguenti passi: installa le dipendenze che non possono essere soddisfatte in un ambiente virtuale, crea poi l'ambiente virtuale, di nome *bacl* (che sta per ba(uble.)cl(assic)), scarica i sorgenti e connette il checkout git alla linea di produzione *bauble-1.0*, dopo di che procede con la sua installazione, che implica lo scaricare tutte le dipendenze. Questo può prender tempo. Infine crea un programmino di avvio di nome *bauble*, nella directory *~/bin* dell'utente corrente.

Se il programmino di installazione termina senza errori, si può ora avviare *bauble*:

```
~/bin/bauble
```

o aggiornare *bauble* all'ultima versione rilasciata nella linea di produzione:

```
~/bin/bauble -u
```

Lo stesso programmino puoi utilizzarlo per cambiare ad un'altra linea di produzione, anche se al momento c'è solo la *bauble-1.0*.

2. su Uniti, apri un terminale, avvia *bauble*, la sua icona (un diamante verde) apparirà nel *launcher*, e se si vuole lo si può saldare al launcher.
3. If you would like to use the default [SQLite](#) database or you don't know what this means then you can skip this step. If you would like to use a database backend other than the default SQLite backend then you will also need to install a database connector.

Se si desidera utilizzare un database [PostgreSQL](#), si attivi l'ambiente virtuale e si installi *psycopg2* con i seguenti comandi:

```
source ~/.virtualenvs/bacl/bin/activate  
pip install -U psycopg2
```

Potrebbe essere necessario risolvere delle dipendenze. Come farlo, dipende dalla distribuzione Linux che si sta utilizzando. Consultare la documentazione corrispondente.

Next...

Connettersi ad una base dati.

2.1.2 Installare su MacOSX

Considerando che MacOSX è unix, la maggior parte dei passi sono uguali al caso Linux, diciamo così.

Una difficoltà importante su MacOSX è che ci sono davvero moltissime versioni diverse di questo sistema operativo e non ci è possibile sostenerle tutte, inoltre Apple «l'impresa» tiene aggiornate solo le ultime due versioni, così che su quelle precedente potrebbe essere difficile o impossibile installare software recente.

Last time we tested, some of the dependencies could not be installed on MacOSX 10.5 and we assume similar problems would present themselves on older OSX versions. Bauble has been successfully tested with 10.7 and 10.9.

Prima di tutto, è necessario completare quello che è un normale ambiente di sviluppo unix, che non è presente in un mac così come esce dal negozio.

1. attrezzi di sviluppo: xcode. verificare sulla wikipedia quale versione è adatta al mac in questione.
2. gestore di pacchetti: homebrew (su versioni più vecchie esiste tigerbrew).

avendo installato le precedenti, eseguire:

```
brew doctor
```

assicurati di aver capito il messaggio di errore, in modo da poter correggere la situazione. pygtk ha bisogno di xquartz e brew non è in grado di risolvere questa dipendenza. per installare xquartz puoi utilizzare brew, o quello che preferisci:

```
brew install Caskroom/cask/xquartz
```

ed ora installare le ultime dipendenze:

```
brew install git  
brew install pygtk # takes time and installs all dependencies
```

seguire le istruzioni su come attivare quanto installato.

il resto segue come su una normale macchina unix, puoi utilizzare lo stesso *devinstall.sh*. Leggi le istruzioni per Linux, seguile, buon utilizzo.

Next...

Connettersi ad una base dati.

2.1.3 Installare su Windows

The Windows installer used to be a «batteries-included» installer, installing everything needed to run Bauble. The current maintainer of bauble.classic cannot run Windows applications. If you want to run the latest version of bauble on Windows: download and install the dependencies and then install Bauble from the source package.

Please report any trouble and help with packaging will be very welcome.

Nota: Bauble è stato provato con successo su WXP, W7 e W8. Molto probabilmente funziona anche su altre versioni, ma non è stato provato.

Nota: Direct download links are given for all needed components. They have been tested in September 2015, but things change with time. If any of the direct download links stops working, please ring the bell, so we can update the information here.

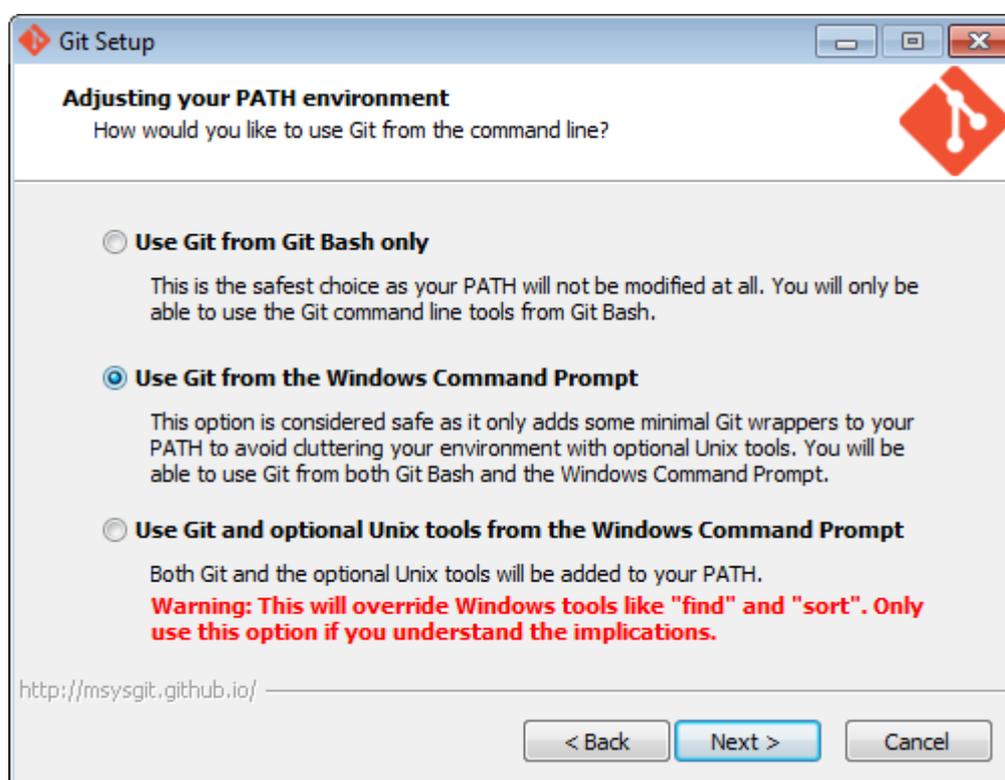

i passi per l'installazione su Windows:

1. scaricare ad installare `git` (viene con un paio di cose buone come `sh` e `vi`), prendendolo da:

<https://git-scm.com/download/win>

Direct link to download git

quasi tutte le opzioni per difetto stanno bene: c'è bisogno di specificare che si vuol eseguire git dalla linea di comando Windows.

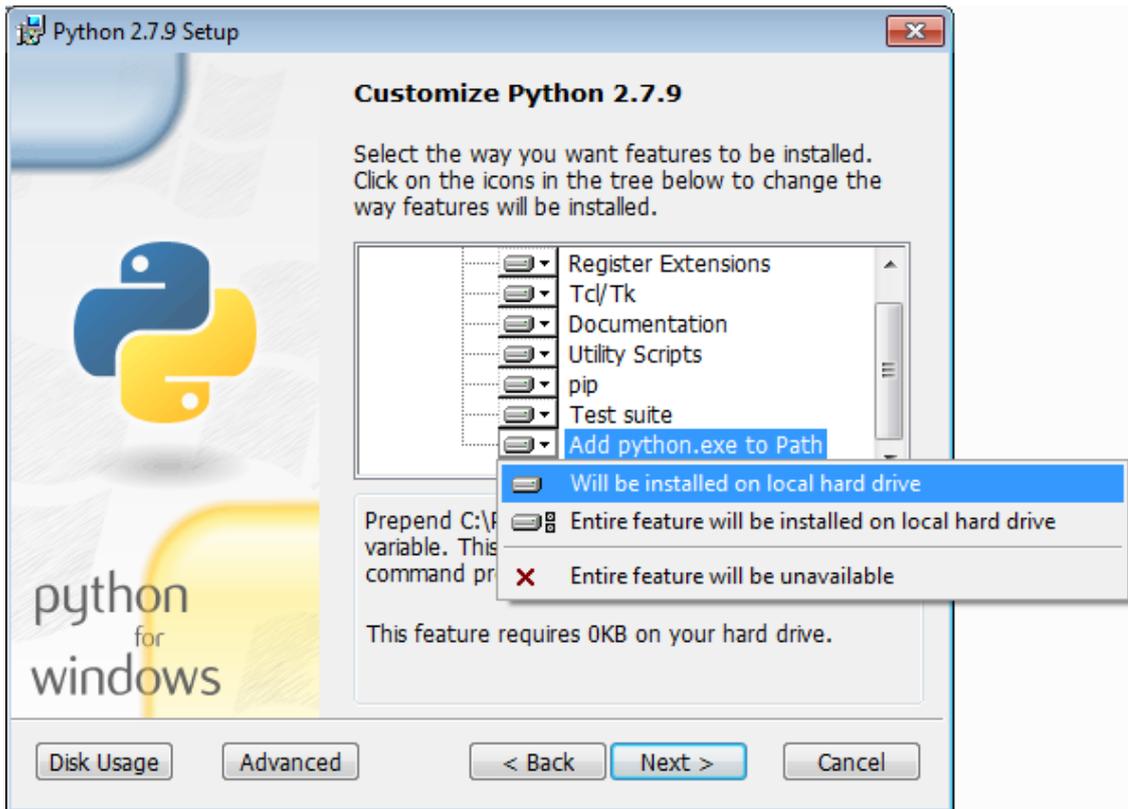

2. scaricare ed installare

<http://www.python.org>

Direct link to download Python

Bauble has been developed and tested using Python 2.x. It will definitely **not** run on Python 3.x. If you are interested in helping port to Python 3.x, please contact the Bauble maintainers.

durante l'installazione di Python, includere Python nel PATH:

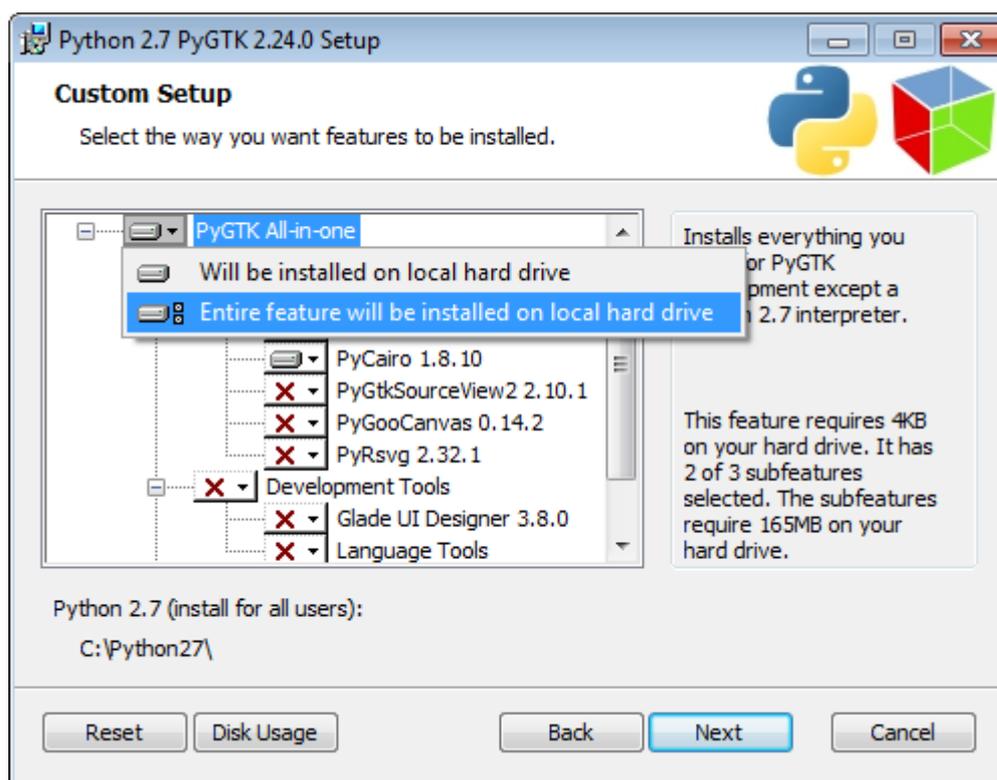

3. scaricare `pygtk` dalla fonte seguente. (richiede python a 32bit). Fare attenzione a scaricare la versione «all in one»:

<http://ftp.gnome.org/pub/GNOME/binaries/win32/pygtk/>

Direct link to download PyGTK

fare una installazione completa, includendo assolutamente tutto:

4. (opzionale) scaricare ed installare connettori database al lato di `sqlite3`, presente per difetto.

Su Windows, NON è facile installare `psycopg2` dai suoi sorgenti utilizzando `pip`, per piacere evitar problemi ed utilizzare un pacchetto precompilato da:

<http://initd.org/psycopg/docs/install.html>

Direct link to download `psycopg2`

5. REINIZIALIZZARE

Giovani, questo è Windows, c'è bisogno di reiniziare il sistema perché i cambiamenti abbiano effetto!

6. scaricare ed eseguire il programmino batch:

```
https://raw.githubusercontent.com/Bauble/bauble.classic/master/
↪scripts/devinstall.bat
```

this will pull the `bauble.classic` repository on github to your home directory, under `Local\github\Bauble`, checkout the `bauble-1.0` production line, create a virtual environment and install `bauble` into it.

puoi anche eseguire `devinstall.bat` passandogli la parte numerica della linea di produzione che si vuol seguire.

7. scaricare il programmino batch, per restare aggiornati con la linea di produzione scelta:

```
https://raw.githubusercontent.com/Bauble/bauble.classic/master/
↪scripts/bauble-update.bat
```

if you are on a recent Bauble installation, each time you start the program, Bauble will check on the development site and alert you of any newer bauble release within your chosen production line.

in ogni momento che si voglia aggiornare l'installazione, basterà aprire la finestra con la linea di comando ed eseguire `bauble-update.bat`

8. you can now start bauble using the `bauble.lnk` shortcut that the installation procedure copies to the `Scripts` directory of the virtual environment:

```
%HOMEDRIVE%%HOMEPATH%\virtualenv\bacl\Scripts\bauble.lnk
```

If you would like to generate and print PDF reports using Bauble's default report generator then you will need to download and install [Apache FOP](#). After extracting the FOP archive you will need to include the directory you extracted to in your `PATH`.

Next...

Connettersi ad una base dati.

2.1.4 Problemi durante l'installazione

1. What are the packages that are installed by Bauble:

I seguenti pacchetti sono richiesti da Bauble

- SQLAlchemy
- lxml

I seguenti pacchetti sono opzionali:

- Mako - required by the template based report generator
- gdata - required by the Picasa photos InfoBox

2. Couldn't install lxml.

The lxml packages have to be compile with a C compiler. If you don't have a Make sure the libxml and libxsl packages are installed. Installing the Cython packages. On Linux you will have to install the gcc package. On Windows there should be a precompiled version available at <http://pypi.python.org/pypi/lxml/2.1.1>

3. Couldn't install gdata.

For some reason the Google's gdata package lists itself in the Python Package Index but doesn't work properly with the `easy_install` command. You can download the latest gdata package from:

<http://code.google.com/p/gdata-python-client/downloads/list>

Unzip it and run `python setup.py installw` in the folder you unzip it to.

Next...

Connettersi ad una base dati.

3.1 Incominciamo

3.1.1 E se fosse SQLite?

Prima di cominciare, domandiamoci tre cose: è la prima volta che uso Bauble?, lavorerò su una sola macchina?, non ho intenzione di sporcarmi le mani con la gestione di basi dati? Bene, se abbiamo risposto affermativamente ad almeno una delle precedenti, mi sà che sarebbe meglio restare con SQLite. SQLite è un sistema SQL rapido, semplice, senza amministrazione.

Con SQLite non c'è bisogno di preparare altro e si può proseguire con *connecting*.

On the other hand, if you want to connect more than one bauble workstation to the same database, or if you want to make your data available for other clients, as could be a web server in a LAMP setting, you should consider keeping your database in a database management system like PostgreSQL or MySQL/MariaDB, both supported by Bauble.

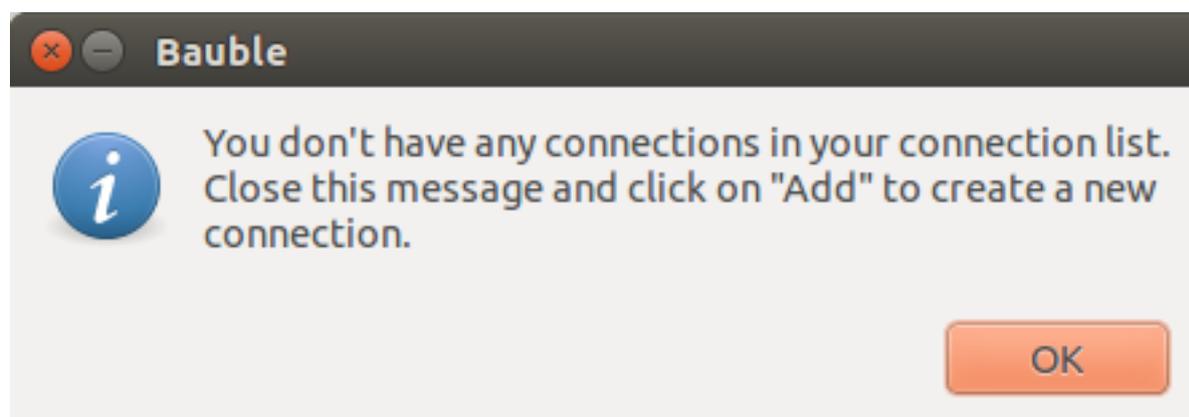

When connecting to a database server as one of the above, you have to manually create: at least one bauble user, the database you want bauble to use, and to give at least one bauble user full permissions on its database. When this is done, Bauble will be able to proceed, creating the tables and importing the default data set. The process is database-dependent and it falls beyond the scope of this manual.

If you already got the chills or sick at your stomach, no need to worry, just stick with SQLite, you do not miss on features nor performance.

3.1.2 Connettersi ad una base dati

All'avviare Bauble, la prima cosa che appare è la finestra per la scelta della connessione.

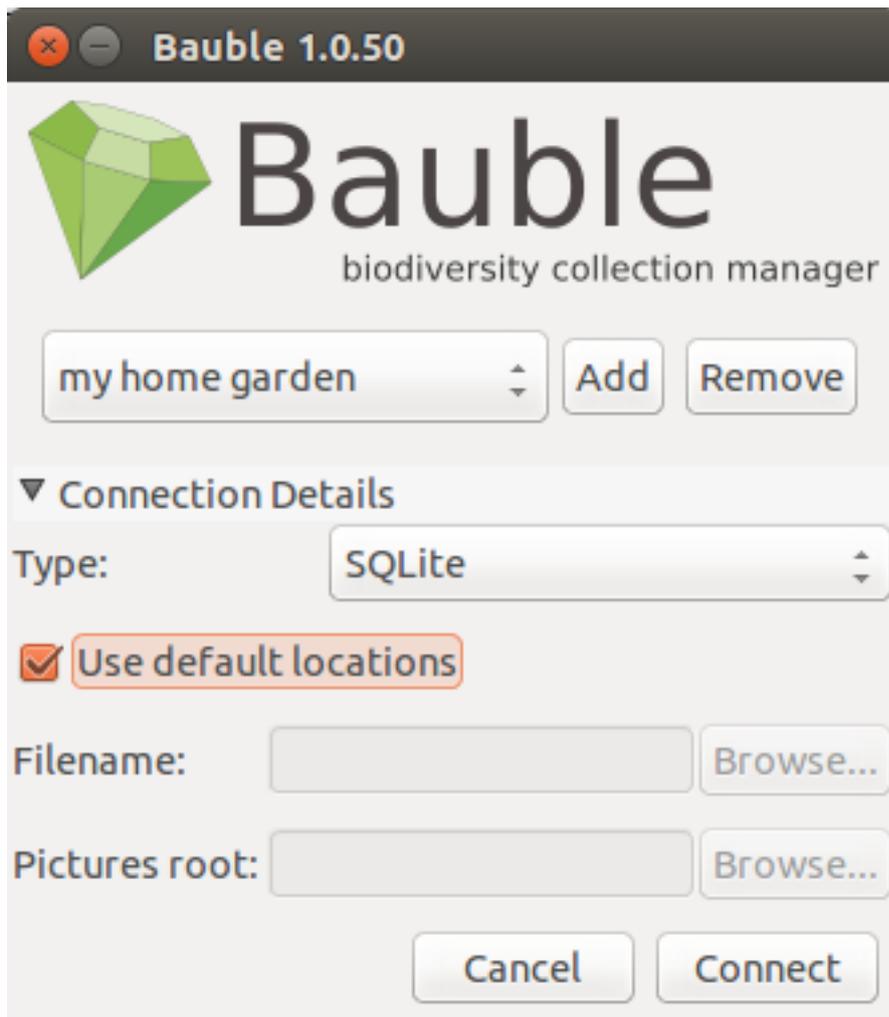

Abbastanza naturalmente, la prima volta che si avvia Bauble non ci saranno connessioni a disposizione. Bauble mostra una finestra di avviso.

Come dice lo stesso testo: chiudere la finestra di avviso, Bauble tornerà alla finestra di connessione, dove selezioneremo **Add** per creare la prima connessione.

Semplicemente: inserire un nome per la connessione, una cosa semplice e significativa che si associ naturalmente alla collezione che si vuol inserire (che so, «alberi monumentali»), e scegliere **OK**. Bauble torna allo schermo precedente, ma il nome della connessione sarà selezionato e la sezione Dettagli della Connessione sarà visibile.

specificare i dettagli della connessione

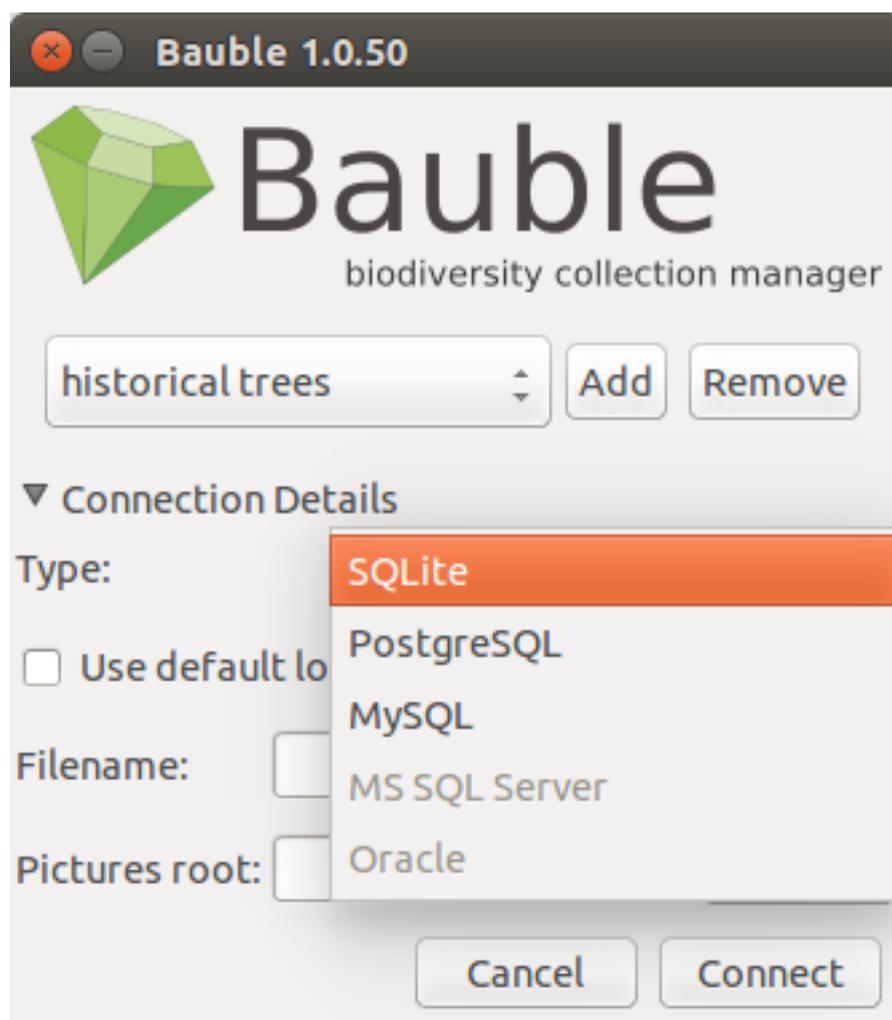

If you do not know what to do here, Bauble will help you stay safe. Activate the **Use default locations** check box and create your first connection by clicking on **Connect**.

You may safely skip the remainder of this section for the time being and continue reading to the following section.

fine-tune the connection details

By default Bauble uses the file-based SQLite database. During the installation process you had the choice (and you still have after installation), to add database connectors other than the default SQLite.

In this example, Bauble can connect to SQLite, PostgreSQL and MySQL, but no connector is available for Oracle or MS SQL Server.

If you use SQLite, all you really need specify is the connection name. If you let Bauble use the default filename then Bauble creates a database file with the same name as the connection and .db extension, and a pictures folder with the same name and no extension, both in `~/ .bauble` on Linux/MacOSX or in `AppData\Roaming\Bauble` on Windows.

Still with SQLite, you might have received or downloaded a bauble database, and you want to connect to it. In this case you do not let Bauble use the default filename, but you browse in your computer to the location where you saved the Bauble SQLite database file.

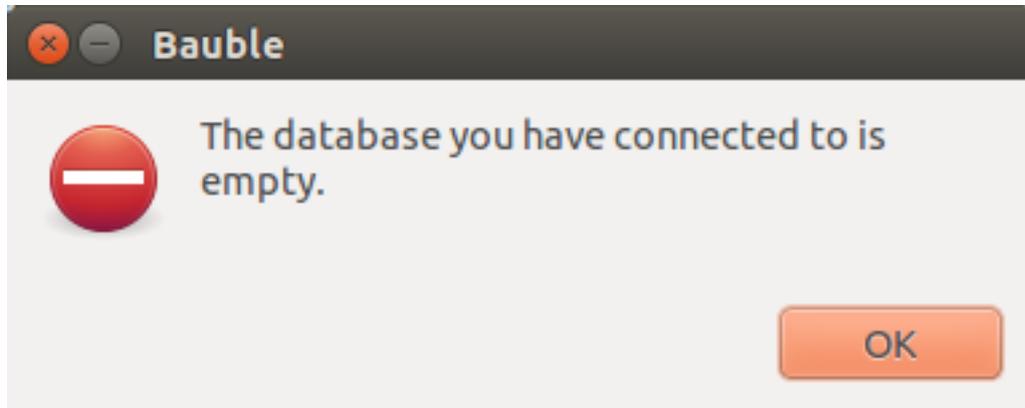

If you use a different database connector, the dialog box will look different and it will offer you the option to fine tune all parameters needed to connect to the database of your choice.

If you are connecting to an existing database you can continue to *Inserire e modificare dati* and subsequently *Searching in Bauble*, otherwise read on to the following section on initializing a database for Bauble.

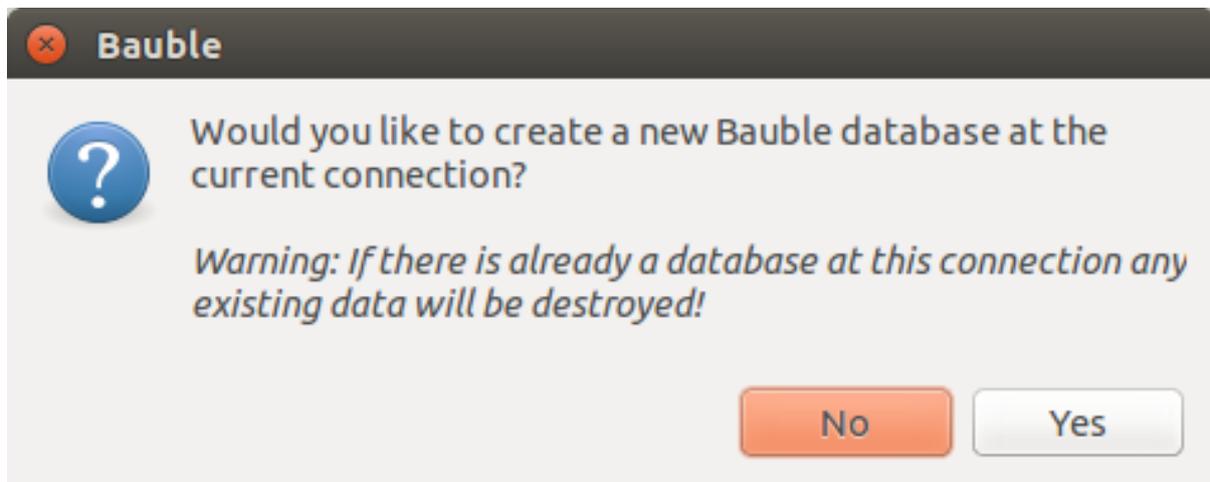

If you plan to associate pictures to plants, specify also the *pictures root* folder. The meaning of this is explained in further detail at *Fotografie* in *Inserire e modificare dati*.

3.1.3 Inizializzare la base dati

La prima volta che si apre una connessione ad una base dati che Bauble non ha mai utilizzato prima, Bauble mostrerà l'avviso:

seguito a ruota da una domanda:

Be careful when manually specifying the connection parameters: the values you have entered may refer to an existing database, not intended for use with Bauble. By letting Bauble initialize a database, the database will be emptied and all of its content be lost.

If you are sure you want to create a database at this connection then select «Yes». Bauble will then start creating the database tables and importing the default data. This can take a minute or two so while all of the default data is imported into the database so be patient.

Una volta creata, configurata, inizializzata la base dati, siamo pronti per iniziare a editing-and-inserting-data ed in seguito :ref: 'searching-in-bauble'.

3.2 Searching in Bauble

Searching allows you to view, browse and create reports from your data. You can perform searches by either entering the queries in the main search entry or by using the Query Builder to create the queries for you. The results of Bauble searches are listed in the main window.

3.2.1 Search Strategies

There are three types of search strategies available in Bauble. Considering the search strategy types available in Bauble, sorted in increasing complexity: you can search by value, expression or query.

Searching by query, the most complex and powerful, is assisted by the Query Builder, described below.

All searches are case insensitive so searching for *Maxillaria* and *maxillaria* will return the same results.

Search by Value

Search by value is the simplest way to search. You just type in a string and see what matches. Which fields/columns are searched for your string depends on how the different plugins are configured. For example, by default the PlantPlugin searches the family name, the genus name, the species and infraspecific species names, vernacular names and geography. So if you want to search in the notes field of any of these types then searching by value is not the search you're looking for.

Examples of searching by value would be: *Maxillaria*, *Acanth*, 2008.1234, 2003.2.1

Search strings are separated by spaces. For example if you enter the search string `Block 10` then Bauble will search for the strings `Block` and `10` and return all the results that match either of these strings. If you want to search for `Block 10` as a whole string then you should quote the string like `"Block 10"`.

Search by Expression

Searching with expression gives you a little more control over what you are searching for. It can narrow the search down to a specific domain. Expression consists of a domain, an operator and a value. For example the search: `gen=Maxillaria` would return all the genera that match the name *Maxillaria*. In this case the domain is `gen`, the operator is `=` and the value is *Maxillaria*.

The search string `gen like max%` would return all the genera whose names start with «Max». In this case the domain again is `gen`, the operator is `like`, which allows for «fuzzy» searching and the value is `max%`. The percent sign is used as a wild card so if you search for `max%` then it searches for all values that start with `max`. If you search for `%max` it searches for all values that end in `max`. The string `%max%a` would search for all values that contain `max` and end in `a`.

For more information about the different search domains and their short-hand aliases, see [search-domains](#).

If expressions are invalid they are usually used as search by value searches. For example the search string `gen=` will execute a search by value for the string `gen` and the search string `gen like` will search for the string `gen` and the string `like`.

Search by Query

Queries allow the most control over searching. With queries you can search across relations, specific columns and join search using boolean operators like AND and OR.

An example of a query would be:

```
plant where accession.species.genus.family=Fabaceae and location.
↪site="Block 10"
```

This query would return all the plants whose family are Fabaceae and are located in Block 10.

Searching with queries usually requires some knowledge of the Bauble internals and database table layouts.

A couple of useful examples:

- Which locations are in use:

```
location where plants.id!=0
```

- Which genera are associated to at least one accession:

```
genus where species.accession.id!=0
```

Domains

The following are the common search domain and the columns they search by default. The default columns are used when searching by value and expression. The queries do not use the default columns.

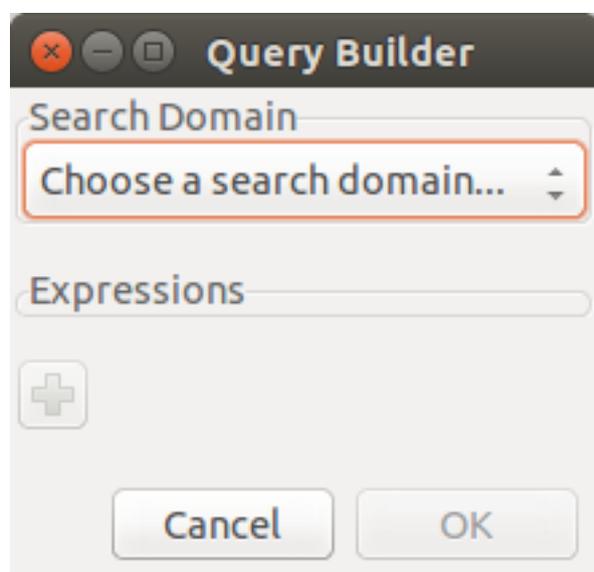

Domains family, fam: Search `bauble.plugins.plants.Family`
 genus, gen: Search `bauble.plugins.plants.Genus`
 species, sp: Search `bauble.plugins.plants.Species`
 geography: Search `bauble.plugins.plants.Geography`
 acc: Search `bauble.plugins.garden.Accession`
 plant: Search `bauble.plugins.garden.Plant`
 location, loc: Search `bauble.plugins.garden.Location`

3.2.2 The Query Builder

The Query Builder helps you build complex search queries through a point and click interface. To open the Query Builder click the to the left of the search entry or select *Tools*→*Query Builder* from the menu.

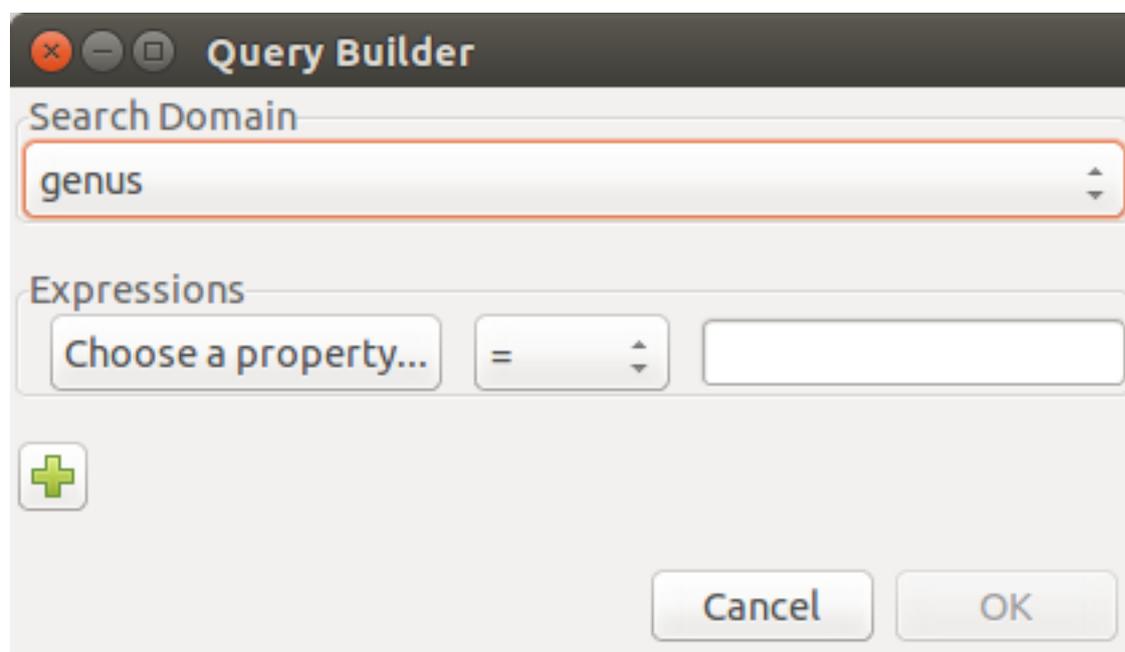

The Query Builder composes a query that will be understood by the Query Search Strategy described above. You can use the Query Builder to get a feeling of correct queries before you start typing them by hand, something that you might prefer if you are a fast typer.

After opening the Query Builder you must select a search domain. The search domain will determine the type of data that is returned and the properties that you can search.

The search domain is similar to a table in the database and the properties would be the columns on the table. Often the table/domain and properties/columns are the same but not always.

Once a search domain is selected you can then select a property of the domain to compare values to. The search operator can then be changed for how you want to make the search comparison. Finally you must enter a value to compare to the search property.

If the search property you have selected can only have specific values then a list of possible values will be provided for you to choose from.

If multiple search properties are necessary then clicking on the plus sign will add more search properties. Select And/Or next to the property name choose how the properties will be combined in the search query.

When you are done building your query click OK to perform the search.

3.3 Inserire e modificare dati

The main way that we add or change information in Bauble is by using the editors. Each basic type of data has its own editor. For example there is a Family editor, a Genus editor, an Accession editor, etc.

To create a new record click on the *Insert* menu on the menubar and then select the type of record you would like to create. This will open a new blank editor for the type.

To edit an existing record in the database right click on an item in the search results and select *Edit* from the popup menu. This will open an editor that will allow you to change the values on the record that you selected.

Most types also have children which you can add by right clicking on the parent and selecting «Add ???...» on the context menu. For example, a Family has Genus children: you can add a Genus to a Family by right clicking on a Family and selecting «Add genus».

3.3.1 Note

Quasi tutti gli editori in Bauble hanno una vista *Note*, che dovrebbe funzionare ugualmente per qualsivoglia editore attivato.

Un indirizzo web inserito a sé stante in una nota, viene trattato in modo speciale da Bauble: quando l'oggetto è selezionato nel pannello risultati, l'indirizzo web verrà mostrato nel contenitore *Links».

You can browse the notes for an item in the database using the Notes box at the bottom of the screen. The Notes box will be desensitized if the selected item does not have any notes.

3.3.2 Famiglia

L'editore per le famiglie permette aggiungere o cambiare una famiglia botanica.

The *Family* field on the editor will change the name of the family. The Family field is required.

The *Qualifier* field will change the family qualifier. The value can either be *sensu lato*, *sensu stricto* or nothing.

Synonyms allow you to add other families that are synonyms with the family you are currently editing. To add a new synonym type in a family name in the entry. You must select a family name from the list of completions. Once you have selected a family name that you want to add as a synonym click on the Add button next to the synonym list and it will add the selected

synonym to the list. To remove a synonym select the synonym from the list and click on the Remove button.

Per annullare le modifiche, fare click sul pulsante *CancellAnnulla*.

Per memorizzare le modifiche effettuate, fare click su *OK*.

Per memorizzare le modifiche e per aggiungere un genere alla famiglia aggiunta o modificata, fare click su *Add Genera*.

To add another family when you are finished editing the current one click on the *Next* button on the bottom. This will save the current family and open a new blank family editor.

3.3.3 Genere

The Genus editor allows you to add or change a botanical genus.

The *Family* field on the genus editor allows you to choose the family for the genus. When you begin type a family name it will show a list of families to choose from. The family name must already exist in the database before you can set it as the family for the genus.

Il campo *Epiteto* permette di specificare l'epiteto di questo genere.

Il campo *Autore* permette di specificare il nome o l'abbreviazione dell'autore o gli autori della pubblicazione del genere.

Synonyms allow you to add other genera that are synonyms with the genus you are currently editing. To add a new synonyms type in a genus name in the entry. You must select a genus name from the list of completions. Once you have selected a genus name that you want to add as a synonym click on the Add button next to the synonym list and it will add the selected synonym to the list. To remove a synonym select the synonym from the list and click on the Remove button.

Per annullare le modifiche, fare click sul pulsante *CancellAnnulla*.

To save the genus you are working on then click *OK*.

To save the genus you are working on and add a species to it then click on the *Add Species* button.

To add another genus when you are finished editing the current one click on the *Next* button on the bottom. This will save the current genus and open a new blank genus editor.

3.3.4 Specie / Tassone

For historical reasons called a *species*, but by this we mean a *taxon* at rank *species* or lower. It represents a unique name in the database. The species editor will allow you to construct the name as well as associate metadata with the taxon such as its distribution, synonyms and other information.

The *Infraspecific parts* in the species editor will allow you to specify the *taxon* further than at *species* rank.

Per annullare le modifiche, fare click sul pulsante *Cancell/Annulla*.

To save the species you are working on then click *OK*.

To save the species you are working on and add an accession to it then click on the *Add Accession* button.

To add another species when you are finished editing the current one click on the *Next* button on the bottom. This will save the current species and open a new blank species editor.

3.3.5 Accessioni

The Accession editor allows us to add an accession to a species. In Bauble an accession represents a group of plants or clones. The accession would refer maybe a group of seed or cuttings from a species. A plant would be an individual from that accession, i.e. a specific plant in a specific location.

Fonti di Accessioni

The source of the accessions lets you add more information about where this accession came from. At the moment the type of the source can be either a Collection or a Donation.

Collezione

Una collezione.

Donazione

Una donazione.

3.3.6 Pianta

Editore per le piante.

Creare più di una pianta

È possibile creare più di una pianta in una sola volta, specificando un intervallo come codice di pianta. Questa opzione è disponibile solo al momento di inserire una nuova pianta, non quando se ne sta modificando una già presente nella base dati.

For example the range, 3-5 will create plant with code 3,4,5. The range 1,4-7,25 will create plants with codes 1,4,5,6,7,25.

When you enter the range in the plant code entry the entry will turn blue to indicate that you are now creating multiple plants. Any fields that are set while in this mode will be copied to all the plants that are created.

Fotografie

Just as almost all objects in the Bauble database can have *Notes* associated to them, Plants can have *Pictures*: next to the tab for Notes, the Plants editor contains an extra tab called «Pictures». You can associate as many pictures as you might need to a plant.

When you associate a picture to a plant, the file is copied in the *pictures* folder, and a miniature (500x500) is generated and copied in the *thumbnails* folder inside of the pictures folder.

As of Bauble-1.0.41, Pictures are not kept in the database. To ensure pictures are available on all terminals where you have installed and configured Bauble, you can use a file sharing service like Copy or Dropbox. The personal choice of the writer of this document is to use Copy, because it offers much more space and because of its «Fair Storage» policy.

Remember that you have configured the pictures root folder when you specified the details of your database connection. Again, you should make sure that the pictures root folder is shared with your file sharing service of choice.

When a Plant in the current selection is highlighted, its pictures are displayed in the pictures pane, the pane left of the information pane. When an accession in the selection is highlighted, any picture associated to the plants in the highlighted accession are displayed in the pictures pane.

3.3.7 Locations

The Location editor

danger zone

The location editor contains an initially hidden section named *danger zone*. The widgets contained in this section allow the user to merge the current location into a different location, letting the user correct spelling mistakes or implement policy changes.

3.4 Tagging

Tagging is an easy way to give context to an object or create a collection of object that you want to recall later. For example if you want to collect a bunch of plants that you later want to create a report from you can tag them with the string «for that report i was thinking about». You can then select «for that report i was thinking about» from the tags menu to show you all the objects you tagged.

Tagging can be done two ways. By selecting one or more items in the search results and pressing Ctrl-T or by selecting *Tag*→*Tag Selection* from the menu. If you have selected multiple items then only that tags that are common to all the selected items will have a check next to it.

3.5 Generating reports

3.5.1 Using the Mako Report Formatter

The Mako report formatter uses the Mako template language for generating reports. More information about Mako and its language can be found at makotemplates.org.

The Mako templating system should already be installed on your computer if Bauble is installed.

Creating reports with Mako is similar in the way that you would create a web page from a template. It is much simpler than the XSL Formatter(see below) and should be relatively easy to create template for anyone with a little but of programming experience.

The template generator will use the same file extension as the template which should indicate the type of output the template with create. For example, to generate an HTML page from your template you should name the template something like *report.html*. If the template will generate a comma seperated value file you should name the template *report.csv*.

The template will receive a variable called *values* which will contain the list of values in the current search.

The type of each value in *values* will be the same as the search domain used in the search query. For more information on search domains see [Domains](#).

If the query does not have a search domain then the values could all be of a different type and the Mako template should prepared to handle them.

3.5.2 Using the XSL Report Formatter

The XSL report formatter requires an XSL to PDF renderer to convert the data to a PDF file. Apache FOP is is a free and open-source XSL->PDF renderer and is recommended.

If using Linux, Apache FOP should be installable using your package manager. On Debian/Ubuntu it is installable as `fop` in Synaptic or using the following command:

```
apt-get install fop
```

Installing Apache FOP on Windows

You have two options for installing FOP on Windows. The easiest way is to download the prebuilt [ApacheFOP-0.95-1-setup.exe](#) installer.

Alternatively you can download the [archive](#). After extracting the archive you must add the directory you extracted the archive to to your PATH environment variable.

3.6 Importare ed esportare dati

Although Bauble can be extended through plugins to support alternate import and export formats, by default it can only import and export comma separated values files or CSV.

There is some support for exporting to the Access for Biological Collections Data it is limited.

There is also limited support for exporting to an XML format that more or less reflects exactly the tables and row of the database.

Exporting ABCD and XML will not be covered here.

Avvertimento: Importing files will most likely destroy any data you have in the database so make sure you have backed up your data.

3.6.1 Importing from CSV

In general it is best to only import CSV files into Bauble that were previously exported from Bauble. It is possible to import any CSV file but that is more advanced than this doc will cover.

To import CSV files into Bauble select *Tools*→*Export*→*Comma Separated Values* from the menu.

After clicking OK on the dialog that asks if you are sure you know what you're doing a file chooser will open. In the file chooser select the files you want to import.

3.6.2 Exporting to CSV

To export the Bauble data to CSV select *Tools*→*Export*→*Comma Separated Values* from the menu.

This tool will ask you to select a directory to export the CSV data. All of the tables in Bauble will be exported to files in the format *tablename.txt* where *tablename* is the name of the table where the data was exported from.

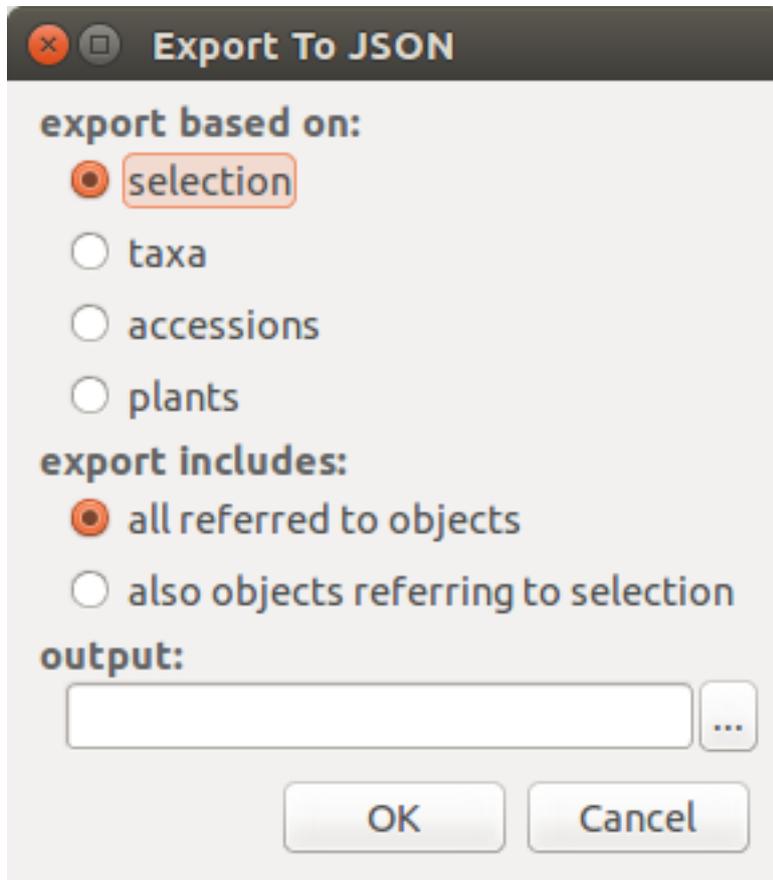

3.6.3 Importare da JSON

This is *the* way to import data into an existing database, without destroying previous content. A typical example of this functionality would be importing your digital collection into a fresh, just initialized Bauble database. Converting a database into bauble json interchange format is beyond the scope of this manual, please contact one of the authors if you need any further help.

Utilizzando il formato di scambio JSON, è possibile esportare dati da una versione di Bauble ed importarli in una versione differente.

3.6.4 Esportare verso JSON

Questo è ancora “lavori in corso”.

when you activate this export tool, you are given the choice to specify what to export. You can use the current selection to limit the span of the export, or you can start at the complete content of a domain, to be chosen among Species, Accession, Plant.

Exporting *Species* will only export the complete taxonomic information in your database. *Accession* will export all your accessions plus all the taxonomic information it refers to: unreferred to taxa will not be exported. *Plant* will export all living plants (some accession might not be included), all referred to locations and taxa.

3.7 Managing Users

Nota: The Bauble users plugin is only available on PostgreSQL based databases.

The Bauble User’s Plugin will allow you to create and manage the permissions of users for your Bauble database.

3.7.1 Creating Users

To create a new user...

3.7.2 Permissions

Bauble allows read, write and execute permissions.

4.1 Amministrazione

Nel caso si stia utilizzando un vero e proprio DBMS (sistema di gestione di basi di dati) per contenere le collezioni di Bauble, è importante prendere in considerazione l'amministrazione di questo DBMS. Una descrizione del compito di amministrare una base dati è qui assolutamente fuori luogo, ma è importante che un utente sia consapevole del problema.

4.1.1 SQLite

SQLite offre una soluzione in quanto SQLite non è esattamente quanto si potrebbe definire un DMBS: ogni base dati SQLite è un file, farne copia di emergenza (backup) sarà sufficiente. Se si è creata la connessione alla base dati SQLite accettando i valori per difetto, il file relativo alla connessione si trova nella directory `~/.bauble/` (con Windows bisognerà trovare la `AppData`).

4.1.2 MySQL

Prego riferirsi alla documentazione ufficiale.

4.1.3 PostgreSQL

Prego riferirsi alla documentazione ufficiale. Una discussione molto approfondita sulle varie opzioni di backup inizia al [chapter_24](#).

5.1 Downloading the source

The Bauble source can be downloaded from our source repository on [github](#).

If you want a particular version of Bauble, we release and maintain versions into branches. you should `git checkout` the branch corresponding to the version of your choice. Branch names for Bauble versions are of the form `bauble-x.y`, where `x.y` can be `1.0`, for example. Our workflow is to commit to the *master* development branch or to a *patch* branch and to include the commits into a *release* branch when ready.

To check out the most recent code from the source repository you will need to install the [Git](#) version control system. Git is included in all reasonable Linux distributions and can be installed on all current operating systems.

Once you have installed Git you can checkout the latest Bauble code with the following command:

```
git clone https://github.com/Bauble/bauble.classic.git
```

For more information about other available code branches go to [bauble.classic on github](#).

5.2 Developer's Manual

5.2.1 helping bauble development

Installing Bauble always includes downloading the sources, connected to the github repository. This is so because in our eyes, every user is always potentially also a developer.

If you want to contribute to Bauble, you can do so in quite a few different ways:

```
* use the software, note the things you don't like, open issue for
↳each of them. a developer will react.
* if you have an idea of what you miss in the software but can't
↳quite
  formalize it into separate issues, you could consider hiring a
  professional. this is the best way to make sure that something
↳happens
  quickly on Bauble. do make sure the developer opens issues and
↳publishes
  their contribution on github.
* translate! any help with translations will be welcome, so please
↳do! you
  can do this without installing anything on your computer, just
↳using the
  on-line translation service offered by http://hosted.weblate.org/
* fork the repository, choose an issue, solve it, open a pull
↳request. see
  the `bug solving workflow`_ below.
```

5.2.2 bug solving workflow

normal development workflow

- while using the software, you notice a problem, or you get an idea of something that could be better, you think about it good enough in order to have a very clear idea of what it really is, that you noticed. you open an issue and describe the problem. someone might react with hints.
- you open the issues site and choose one you want to tackle.
- assign the issue to yourself, this way you are informing the world that you have the intention to work at it. someone might react with hints.
- optionally fork the repository in your account and preferably create a branch, clearly associated to the issue.
- write unit tests and commit them to your branch (do not commit failing unit tests to the `master` branch).
- write more unit tests (ideally, the tests form the complete description of the feature you are adding or correcting).
- make sure the feature you are adding or correcting is really completely described by the unit tests you wrote.
- make sure your unit tests are atomic, that is, that you test variations on changes along one single variable. do not give complex input to unit tests or tests that do not fit on one screen (25 lines of code).
- write the code that makes your tests succeed.

- update the `i18n` files (run `./scripts/i18n.sh`).
- whenever possible, translate the new strings you put in code or glade files.
- commit your changes.
- push to github.
- open a pull request.

publishing to production

- open the pull request page using as base the production line, compared to `master`.
- make sure a `bump` commit is included in the differences.
- it should be possible to automatically merge the branches.
- create the new pull request, call it as “publish to the production line”.
- you possibly need wait for travis-ci to perform the checks.
- merge the changes.
- tell the world about it: on facebook, the google group, linkedin, ...

closing step

- review this workflow. consider this as a guideline, to yourself and to your colleagues. please help make it better and matching the practice.

5.2.3 structure of user interface

the user interface is built according to the Model-View-Presenter architectural pattern. The **view** is described in a glade file and is totally dumb, you do not subclass it because it implements no behaviour and because its appearance is, as said, described elsewhere, including the association signal-callbacks. The **model** simply follows the sqlalchemy practices.

You will subclass the **presenter** in order to:

- define `widget_to_field_map`, the association from name of view object to name of model attribute,
- override `view_accept_buttons`, the list of widget names which, if activated by the user, mean that the view should be closed,
- define all needed callbacks,

The presenter should not know of the internal structure of the view, instead, it should use the view api to set and query the values inserted by the user. The base class for the presenter, `GenericEditorPresenter` defined in `bauble.editor`, implements many generic callbacks.

Model and Presenter can be unit tested, not the View.

The `Tag` plugin is a good minimal example, even if the `TagItemGUI` falls outside this description. Other plugins do not respect the description.

We use the same architectural pattern for non-database interaction, by setting the presenter also as model. We do this, for example, for the JSON export dialog box.

5.2.4 building (on Windows)

Building a python program is a bit of a contraddiction. You don't normally *build* nor *compile* a python program, you run it in its (virtual) environment, and python will process the modules loaded and produce faster-loading *compiled* python files. You can, however, produce a *Windows executable* from a python script, executable containing the whole python environment and dependencies.

1. Follow all steps needed to set up a working Bauble environment from *Installazione*, but skip the final `install` step.
2. instead of *installing* Bauble, you produce a Windows executable. This is achieved with the `py2exe` target, which is only available on Windows systems:

```
python setup.py py2exe
```

3. At this point you can run Bauble. To run the compiled executable run:

```
.\dist\bauble.exe
```

or copy the executable to wherever you think appropriate.

4. To optionally build an NSIS installer package you must install NSIS from nsis.sourceforge.net. After installing NSIS right click on `.\scripts\build.nsi` in Explorer and select *Compile NSIS Script*.

5.3 Extending Bauble with Plugins

Nearly everything about Bauble is extensible through plugins. Plugins can create tables, define custom searches, add menu items, create custom commands and more.

To create a new plugin you must extend the `bauble.pluginmgr.Plugin` class.

5.4 API Documentation

5.4.1 bauble

5.4.2 bauble.db

`bauble.db.Base`

All tables/mappers in Bauble which use the SQLAlchemy declarative plugin for

declaring tables and mappers should derive from this class.

An instance of `sqlalchemy.ext.declarative.Base`

`bauble.db.metadata`

The default metadata for all Bauble tables.

An instance of `sqlalchemy.schema.MetaData`

5.4.3 `bauble.connmgr`

5.4.4 `bauble.editor`

5.4.5 `bauble.i18n`

5.4.6 `bauble.ui`

5.4.7 `bauble.meta`

5.4.8 `bauble.paths`

5.4.9 `bauble.pluginmgr`

5.4.10 `bauble.prefs`

5.4.11 `bauble.task`

5.4.12 `bauble.types`

5.4.13 `bauble.utils`

5.4.14 `bauble.view`

`class` `bauble.view.SearchView.ViewMeta`

5.4.15 `bauble.search`

5.4.16 `bauble.plugins.plants`

5.4.17 `bauble.plugins.garden`

5.4.18 `bauble.plugins.abcd`

5.4.19 `bauble.plugins.imex`

5.4.20 `bauble.plugins.report`

5.4.21 `bauble.plugins.report.xsl`

5.4.22 `bauble.plugins.report.mako`

5.4.23 `bauble.plugins.tag`

CAPITOLO 6

Appoggiare Bauble

Se utilizzi Bauble, o se ti sembra giusto aiutarne lo sviluppo, puoi considerare una [donazione](#)
